

Installation Instructions for **HOT POT JUNIOR™** Soup Can Warmer

SOUP UP your sled or ATV in just a few minutes!

Here's all you have to do to get your HOT POT JUNIOR™ installed in just minutes!

PHOTO A: Snowmobile

PHOTO B: ATV

- Remove the HOT POT JUNIOR™ and the stainless steel band clamps from the package.
- As seen in photo A or B, install as shown in a location allowing easy access for insertion and removal of soup can.
- For optimal heat transfer, the aluminum heat transfer plate should be installed so that it directly contacts the exhaust pipe. On most snowmobiles or ATVs it is best to install the mounting plate where the pipe bends several inches after coming out of the exhaust port. The closer the assembly is to the exhaust port the faster your soup can will heat.
NOTE: PHOTO B shows installation on ATV: we recommend placement much further forward on the pipe or your soup will take forever to heat.
- Using a standard screwdriver, fasten the **mounting clamp** around the **soup can clamp** (the one with the wingnut) and the exhaust pipe.
- Fully tighten the mounting clamp to prevent rotation and vibration during operation.
- On snowmobiles, carefully lower the hood of your snowmobile to ensure proper clearance. You should install HOT POT JUNIOR with a minimum of 3/4" to 1" clearance to the hood. (IMPORTANT: If the HOT POT JUNIOR™ touches the hood of your snowmobile it may discolor or distort your bodywork! If this is the case, loosen the mounting clamp and rotate or relocate to allow hood to close properly with 3/4" to 1" clearance.)
- Drop soup or chili can into HOT POT JUNIOR and tighten wingnut to hold securely in place.
- You're ready to go!

CAUTION-SAFETY HAZARD!

Your HOT POT JUNIOR can reach extreme temperatures!

To state the obvious, we strongly recommend that you wear heat resistant (ie, leather) gloves at all times when handling the HOT POT JUNIOR™. FTI will not be liable for any burns which may result from either proper or improper use of the HOT POT JUNIOR™ soup can warmer.

IT IS EXTREMELY IMPORTANT that you regularly monitor soup can temperature to prevent explosion. The goal should never be to heat to boiling temperature—anything between 150 and 180 degrees F is plenty hot. Although we never had a soup can explode during development and testing, there is always a first time for everything. Finally, exercise caution when heating the new "pop-top" style soup or chili cans as they more likely to burst compared to regular cans.

Cooking times will vary as a result of both snow conditions and the terrain you're riding. On groomed trails warming will take longer because the engine won't be working as hard. If you want to accelerate cooking times either find some deeper snow to ride in or climb a hill a few times. This will cause the engine to work harder which will create more exhaust heat. (Sorry flatlanders, you'll just have to find a frozen lake and run at full throttle for a few minutes.....) HINT: Think FAST FOOD—the faster you go, the faster it cooks.
